# Flex InterLocker v0.1.7

By 4O3A

This is a free app that provides interlock functionality for FlexRadio radios used for contesting on the 4O3A station. We decided to make it public and share it with the contest community.

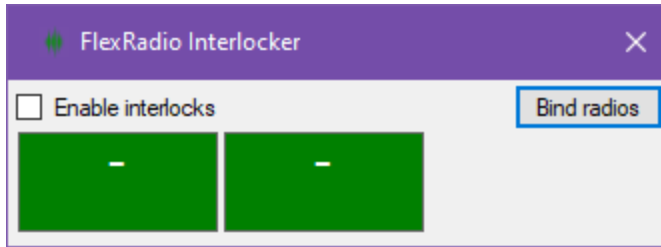

**Bind radios** will display a list of the FlexRadio serials on the network.

Shift-click all the radios you want to interlock with and click **Connect**.

If you can not see the radios try turning of your firewall.

The radios will display as rectangles, the color will show the status of the radio.
Green for **not active PTT** and **red** for **active PTT**, the interlocker radio as **blue.**

Right click a radio to **name it**.

Enable interlock will enable interlock.
Interlock should be enabled only on one PC, the other should have it disabled and use the app as a monitoring tool to avoid conflicts.

Left click a radio to set the priority.
If no radio has priority, the first one wins.
If a radio has priority it will interlock the other (active) transmitter.

The maximum number of radios is infinite and the window is freely resizable.
Green for **not active PTT** and **red** for **active PTT**, the interlocker radio as **blue.**
